ABSTRACT

Customer Relationship Management (CRM) systems play a vital role in improving business operations, customer satisfaction, and overall productivity. The project titled **"A CRM Application for TheChaiShop&Co"** focuses on designing and implementing a cloud-based CRM solution using the Salesforce platform to automate customer management and sales processes.

TheChaiShop&Co is a retail business that handles multiple customer transactions daily, including both online and walk-in orders. Previously, customer records and billing calculations were maintained manually, leading to errors, inefficiencies, and delayed reporting.

To overcome these challenges, a centralized CRM system was developed. The application includes custom objects such as Employer Account, Customer Account, and Enterprise Account to store structured and organized data. Formula fields are used to automatically calculate order quantity and total bill amount based on selected products, eliminating manual calculation errors.

The system also incorporates validation rules to ensure accurate data entry, preventing incorrect phone numbers, Aadhar numbers, and PAN details from being saved. Record types and customized page layouts are created to differentiate between online and walk-in orders, providing a better user interface and improved data categorization.

An important feature of the system is automation through scheduled-triggered flows. Reports and dashboards are generated to provide real-time graphical insights into sales performance and customer activity, enabling managers to make informed and data-driven decisions.

The CRM system is cloud-based, secure, scalable, and accessible 24/7, ensuring high availability and reliability. Overall, this project demonstrates practical implementation of CRM concepts using Salesforce and showcases how automation and analytics can significantly improve operational efficiency, data accuracy, and customer relationship management.

INTRODUCTION

In today's competitive business environment, maintaining strong customer relationships and managing sales data efficiently are essential for business success. Many small and medium-sized businesses still rely on manual record-keeping methods such as notebooks and spreadsheets. These traditional methods often lead to calculation errors, data duplication, loss of information, and difficulty in generating reports.

TheChaiShop&Co is a retail business that sells tea powders, cookies, and gift hampers to both individual customers and enterprise clients. As the business grows, managing customer details, tracking orders, and calculating bills manually becomes increasingly difficult. Employees may spend more time on administrative tasks rather than focusing on customer service and business development.

To solve these challenges, a cloud-based CRM application was developed using Salesforce. Salesforce provides a powerful platform for creating customized applications that support automation, secure data storage, and real-time analytics.

The CRM application developed for TheChaiShop&Co includes:

- Custom objects to manage Employer, Customer, and Enterprise accounts
- Automated order quantity and total bill calculation using formula fields
- Validation rules to ensure accurate data entry
- Record types to differentiate online and walk-in orders
- Email automation for birthday notifications
- Reports and dashboards for sales analysis

By implementing this system, the business can centralize its data, reduce manual workload, improve accuracy, and enhance customer engagement. The CRM application ensures better operational efficiency and supports informed decision-making through real-time insights.

This project demonstrates practical knowledge of CRM concepts and shows how technology can transform traditional business processes into efficient digital systems.

PROBLEM STATEMENT

TheChaiShop&Co currently lacks a centralized and automated system to manage customer relationships, sales transactions, and business records efficiently. The existing process depends on manual data entry and billing calculations, which leads to operational inefficiencies and errors.

Problems Faced by Sales Representatives

Sales representatives are responsible for managing customer orders and generating bills. However:

- Order quantity and total bill amount are calculated manually.
- Manual calculations often result in incorrect billing.
- Customer details must be updated manually without automation support.

Because of these issues, sales representatives experience stress and inefficiency while handling daily transactions.

Problems Faced by Store Managers

Store managers need accurate reports to monitor sales and customer performance. However:

- Sales reports are delayed and sometimes incomplete.
- Data is stored in multiple files and registers.
- There is no centralized system for real-time analysis.

This makes decision-making difficult and reduces overall business efficiency.

Problems Faced by Customers

Customers expect personalized service and timely communication. However:

- There is no automated communication system.
- Customers do not receive birthday notifications or special offers.
- Customer engagement is minimal.

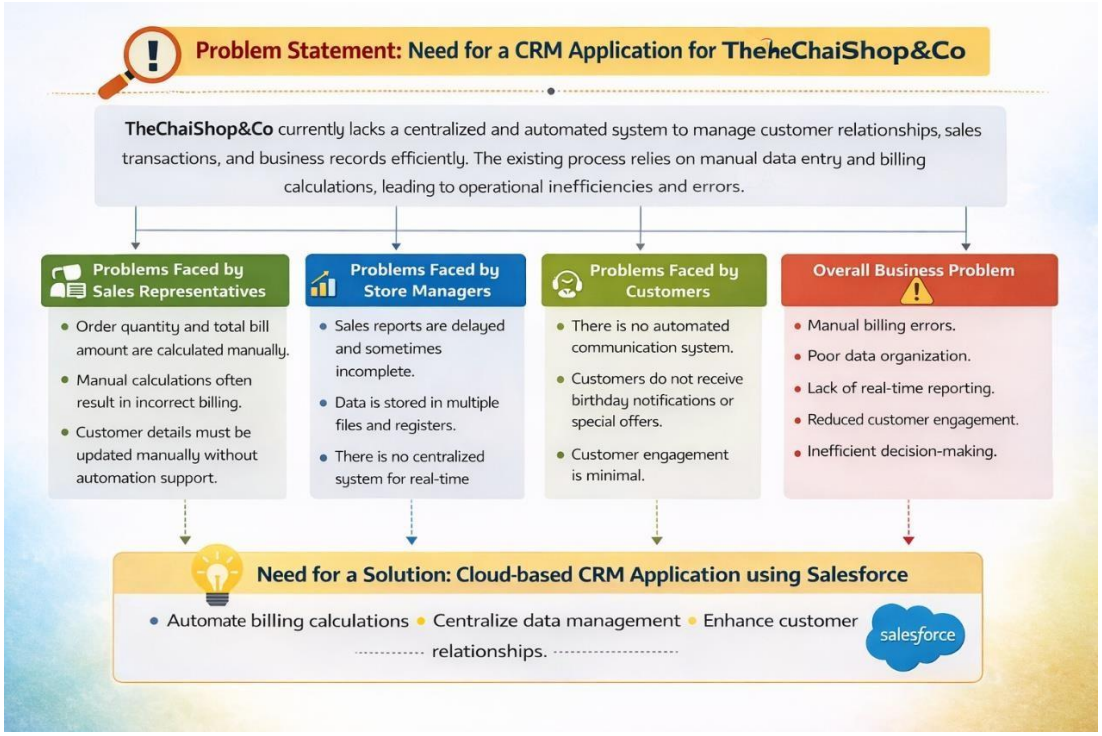
Overall Business Problem

Due to the absence of an automated CRM system, TheChaiShop&Co faces:

- Manual billing errors
- Poor data organization
- Lack of real-time reporting
- Reduced customer engagement
- Inefficient decision-making

Additionally, the business lacks proper data validation mechanisms to ensure accurate information entry. The absence of standardized data fields leads to inconsistencies in customer records. There is no structured workflow to streamline order processing activities. These operational gaps directly impact productivity, service quality, and long-term business growth.

Therefore, the business requires a cloud-based CRM solution using Salesforce to streamline operations, automate sales calculations, centralize data management, and enhance customer relationship management.



PROPOSED SOLUTION

To overcome the challenges faced by TheChaiShop&Co, a cloud-based Customer Relationship Management (CRM) system is proposed and developed using the Salesforce. The proposed system provides a centralized, automated, and structured solution for managing customer accounts, sales processes, and business reporting.

Centralized Data Management

The system introduces custom objects such as:

- Employer Account
- Customer Account
- Enterprise Account

These objects help in storing and organizing business data in a structured and centralized manner..

Automation of Billing Process

To reduce manual errors:

- Formula fields are created to automatically calculate **Order Quantity**.
- Formula fields are generate the **Total Bill Amount** automatically.

This ensures accurate billing without manual calculations and reduces workload for sales representatives.

Data Validation Mechanism

Validation rules are implemented to:

- Ensure correct format for Aadhar Number
- Validate PAN Number format
- Restrict phone number entry to valid digits
- This improves data accuracy and prevents incorrect information from being saved.

Record Types and Page Layout Customization

Two record types are created:

- Online Orders
- Walk-In Orders

Separate page layouts are designed to provide a better user interface and proper classification of customer transactions.

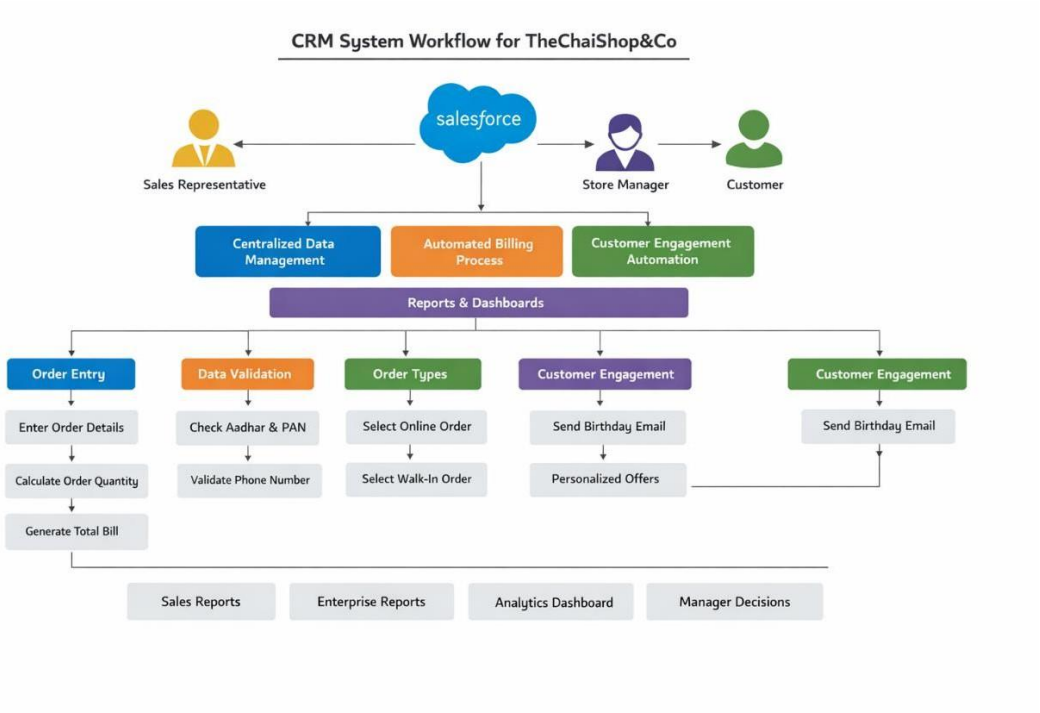
Reporting and Dashboard Analytics

The system generates:

- Customer Sales Reports
- Enterprise Sales Reports
- Interactive Dashboards

These reports provide real-time graphical insights that help managers analyze business performance and make informed decisions.

WORK FLOW DIAGRAM



SUMMARY

The project **"A CRM Application for TheChaiShop&Co"** focuses on developing a cloud-based Customer Relationship Management system using the Salesforce platform to automate customer and sales management processes.

The system replaces manual record-keeping and billing calculations with a centralized and automated solution. Custom objects such as Employer Account, Customer Account, and Enterprise Account were created to ensure structured data storage. Formula fields automatically calculate order quantity and total bill amount, improving billing accuracy and reducing human errors.

Validation rules were implemented to maintain proper data entry formats for phone numbers, Aadhar, and PAN details. Record types were introduced to differentiate between online and walk-in orders, improving data classification. A schedule-triggered flow was configured to automatically send birthday email notifications to customers, strengthening customer engagement.

Reports and dashboards were designed to provide real-time insights into sales performance, customer trends, and business activities. These analytical tools assist store managers in making informed and data-driven decisions. The centralized database ensures easy access, better organization, and improved transparency.

Furthermore, the system enhances operational efficiency by minimizing repetitive manual tasks and reducing processing time. The cloud-based environment ensures data security, reliability, and 24/7 accessibility. The application is scalable, allowing the business to expand operations without major structural changes.

The implementation of automation features reduces dependency on manual supervision. The CRM system improves coordination between sales representatives and store managers. It enables faster retrieval of customer information during transactions. The platform supports accurate tracking of customer purchase history. The structured workflow ensures smooth order processing. Overall, the system contributes to improved service quality and long-term organizational success.

CONCLUSION

The project **"A CRM Application for TheChaiShop&Co"** successfully demonstrates the design and implementation of a cloud-based Customer Relationship Management system using the Salesforce platform. The system effectively resolves the challenges associated with manual data handling, billing inaccuracies, scattered records, and delayed reporting.

By introducing custom objects such as Employer, Customer, and Enterprise Accounts, the application ensures structured and centralized data storage. The use of formula fields for automatic order quantity and total bill calculation significantly reduces manual effort and eliminates calculation errors. Validation rules improve data accuracy by enforcing proper input formats for essential fields such as phone numbers, Aadhar, and PAN details.

The implementation of record types and customized page layouts enhances data classification and improves user experience. Automated customer engagement through scheduled birthday email notifications strengthens relationships and increases customer satisfaction. Reports and dashboards provide real-time insights into sales performance and business trends, enabling managers to make informed and strategic decisions.

The CRM system enhances productivity by reducing repetitive tasks and improving workflow efficiency. The cloud-based architecture ensures high security, reliability, scalability, and 24/7 accessibility. The integration of automation, analytics, and customer management features into a single platform supports better coordination among employees and improves service quality.

Overall, the project reflects a successful digital transformation from manual operations to an automated and intelligent CRM solution. It demonstrates practical knowledge of Salesforce tools and showcases how technology-driven solutions can enhance operational efficiency, improve customer relationships, and contribute to sustainable business growth.
